**Top Tips**

1. Satisfaction of search – in cases of multiple fractures, always search hard for the additional subtle and hidden fracture.

2. Soft tissue swelling and displaced fat pads – use these to help guide you to a subtle fracture.

3. Understanding the mechanism of injury and by looking for the frequently associated fractures.

4. Overlying structures – pay extra attention to areas where multiple bony surfaces overlap as fractures can be easily missed here.

5. Ligamentous/tendinous insertion points – avulsion injuries can often be subtle and small.

6. Metalwork – pay extra attention to the surrounding bone for subtle peri-prosthetic fractures.

7. Building “Review Areas” – this can be done by using the above tips and knowledge of frequently missed subtle fractures such as the ones shown on this poster.
